Security

The Security service offers to professionally secure your network via the latest technology with the option of flexibly adjusting the configuration.

The **SECURITY** service has been designed as a complex security service for the Internet communication of Dial Telecom customers. The service is based on leading UTM technology, enabling the protection of the network against attacks and the set-up of rules for particular groups of employees when using the network. The technology is continually supported by updates in order to be able to respond to the latest security threats. Control is performed at the level of identification and monitoring of individual users' behavior and the applications, as well as the content, which gets into the network. Based on current needs, any network administrator can change the rules for using the network or the Internet through an intuitive user interface. Dial Telecom support can be used for more complex changes to the set-up.
